INVESTIGATIONS OF RELAXATION PHENOMENA IN ALKALI-SILICATE GLASSES (Untersuchungen von Relaxationserscheinungen an Alkali-Silikat-Gläsern). Extract from thesis, Friedrich Schiller U., 1958. [1961] [30]p. 27 refs.
Order from SLA mi$2.60, ph$4.80 61-10696

Trans. of Glastechnische Berichte (West Germany) 1960, v. 33, no. 1, p. 10-19.

Measurements are made of the temperature dependence of the internal friction and of the elastic modulus of alkali-silicate glasses at temperatures between -180°C. and the point of transformation. The simple alkali silicates show two pronounced maxima of damping, whereas the mixed alkali silicates show only one clear maximum, which, however, is enormously raised. Level and temperature position of the maxima depend on the alkali content. The course of the elastic modulus is likewise determined by the alkali concentration of the glasses.

In order to determine the total sulfur content in fresh garlic, the fresh drug must be treated with concentrated nitric acid, in order to avoid losses of volatile sulfur compounds. Only then is the previously oxidized drug decomposed with sodium nitrate. Furthermore, a determination of the Allicin or Alliin in fresh garlic is given, in which the pyroracemic acid formed in stoichiometric amounts during the enzymatic decomposi-

Order from SLA $1.60 63-14820

Trans. of mono. Festskr[ift Tillägnad] J. Arvid Hedvall [Gothenburg] 1948, p. 303-318.

DESCRIPTORS: *Rock salt, *Sodium compounds, *Chlorides, *Gases, *Sulfur compounds, *Oxides, Temperature, *Reaction kinetics.

In the absence of moisture, the reaction between sodium chloride and roasting gas proceeds with the formation of sodium sulfate and chlorine at a constant linear velocity if the temperature and $SO_2$ concentration are maintained constant; i.e., the velocity of the process is determined by the rate of a phase-boundary process and is not retarded by the reaction products. The reaction velocity is a function of the gas composition and the temperature. (Author)
